Tirurkad, Malappuram, kerala.

Higher Secondary

May 2012 – March 2014

Nss Karayogam Higher Secondary School
Valiyaparamba, malappuram, kerala

Project

Vehicle Speed Tracking System

It is a device that is based on the software and help in navigating routes, tracking vehicles and helps Motor inspectors to track a vehicle which commits accidents or break the rule. The idea of this project is to give sufficient information about a vehicle and its location from an embedded system to the RTO's Server. So, here we use a GSM technology to send information via a Sim card placed in the Sim Slot of the device. Sending simply an sms won't help the RTO to track the vehicle fast.Interestingly, we designed this system with a GPS module, which accurately gives the information of a vehicle current location. To control the GPS and GSM modules, we use the Arduino UNO board which has an AT Mega 328 microcontroller. The information is received by a server–side which initially developed using PHP language.
